

Log4Shell Vulnerability

CommScope / ARRIS is committed to the security of our devices and the millions of subscribers/customers who use them.

CommScope learned of the Log4Shell vulnerability on Dec. 9, 2021. As soon as we learned of these vulnerabilities, we immediately began assessing applicability to our products. Where necessary, we started developing firmware patches. We also evaluated other mitigation approaches to minimize the potential impact of the Log4Shell vulnerabilities.

None of our retail and broadband CPE devices (i.e., gateways, modems, extenders) were impacted by this vulnerability, and neither were our video set top solutions.
